

COMS BC1016

Introduction to Computational Thinking and Data Science

# Lecture 7: Histograms

BARNARD COLLEGE OF COLUMBIA UNIVERSITY

Sept 30, 2025

# Reminders

- HW 1 is due Today
- HW 2 due next week Wednesday
- Remember to run the last cell

## ▼ Barnard BC 1016 Submission Instructions

First, make sure you have run all cells up to this point. Next, run the last cell in this notebook ( `grader.export(pdf=run_tests=True)` ) to run a last set of tests.

Once you can view all the test results from running the `grader.export` cell, please export a PDF of your notebook following these instructions:

1. Go to File > Print
2. Select the option to export a PDF. In the preview, ensure that your entire notebook contents are visible including test results.
3. Save the PDF and submit via Courseworks. Homeworks should be submitted to BC1016, and Lab assignments should be submitted to BC1017

**Note, please ignore the Data8 instructions about submitting a zip file - you should still run the `grader.export` cell and export a PDF instead as per the instructions above**

## Submission

Make sure you have run all cells in your notebook in order before running the cell below, so that all images/graphs appear in the output. The cell below will generate a zip file for you to submit. **Please save before exporting!**

```
50]: # Save your notebook first, then run this cell to export your submission.
grader.export(pdf=False, run_tests=True)
```

Running your submission against local test cases...

Your submission received the following results when run against available test cases:

q3\_1\_2 results: All test cases passed!

q3\_3\_1 results: All test cases passed!

q3\_3\_2 results: All test cases passed!

q4\_1\_1 results: All test cases passed!

q51 results: All test cases passed!

q5\_1\_1 results: All test cases passed!

Your submission has been exported. Click [here](#) to download the zip file.

Type Markdown and LaTeX:  $\alpha^2$

# Lecture Outline

- Histograms (continued)
- Census Demo
- Chart Selection Demo with Weather Data

# Visualizing Categorical Data

# Area Principle for Histograms

# Area Principle

Areas should be *proportional* to the values they represent

In a histogram, the **area** of each bar is the **percent** of individuals in the corresponding bin

(Later on in the course, we will approximate histograms with smooth curves)

# Histograms

The **area** of each bar is a **percentage** of the whole

The **horizontal axis** is a numerical distribution - the bins don't need to be of equal size

The **vertical axis** is a rate (e.g., percent/year) - density

Bin size = 5

# Area Principle

Areas should be proportional to the values they represent

- For example
  - If you represent 20% of a population by:
  - Then 40% can be represented by:
  - But not by:

# Area Principle

Areas should be proportional to the values they represent

- For example
  - If you represent 20% of a population by:
  - Then 40% can be represented by:
  - But not by:

# Unequal Bin Sizes

Bin sizes don't need to be equal

- unequal bin size is often used for better representing tails

For unequal bin sizes - vertical axis now represents ***density*** rather than frequency

# Calculating Heights

The [40, 65) bin contains  
59/200 items

- The bin is 29.5% (59/200) of the whole
- The bin width is  $65 - 40 = 25$  years

- Height = 
$$\frac{29.5 \text{ percent}}{25 \text{ years}}$$
$$= 1.18\% \text{ per year}$$

# Area Notebook Demo

# Bar Chart vs Histogram

## Bar Chart

- Distribution of **categorical** variable
- Length of bars is proportional to the frequency / percent of individuals

## Histogram

- Distribution of **numerical** variable
- Horizontal axis is numerical, bins can be unequal
- **Area** of bars is proportional of percent of individuals, **height** measures density

# Charts Summary

Type	Syntax	Description
Line graph	<code>.plot(x_axis, y_axis)</code>	Sequential data
Scatter Plot	<code>.scatter(x_axis, y_axis)</code>	Relation between two numerical values
Bar Chart	<code>.barh(column_label)</code>	Distribution of one <b>categorical variable</b> (already grouped)
Histogram	<code>.hist(column_label, unit, bins)</code>	Distribution of one <b>numerical variable</b>

# Chart Selection Exercise

We have NYC weather data from 2019 as shown below (from [Kaggle](#))

**Which type of chart (line, scatter, bar, histogram) would best help you answer to each question?**

- Do days with hotter highs also tend to have hotter lows?
- How do the number of rainy days compare with the number of snowy days?
- What percent of days have a high of at least 75 degrees?

date	tmax	tmin	tavg	condition
1/1/19	60	40	50	rainy
2/1/19	41	35	38	
3/1/19	45	39	42	
4/1/19	47	37	42	
5/1/19	47	42	44.5	rainy
6/1/19	49	32	40.5	
7/1/19	35	26	30.5	
8/1/19	47	35	41	rainy
9/1/19	46	35	40.5	rainy
10/1/19	35	30	32.5
